

Re:system M100 – Setting of amplifier

The Re:system M100 offers an excellent amplifier with 2 x 200 Watt for an outstanding music experience. The sound adventure of the M100 amplifier is always an enjoyment regardless of which speaker is connected. Once again a Revox product offers absolute listening pleasure.

With a couple of settings in the configuration menu of the M100 the sound experience can even be optimised. On the one hand the speaker can be adapted to the positioning within the room and therefore equalize a super elevation of the frequency response in the low frequencies.

In the DSP of the M100, on the other hand, the frequency ranges of the current Revox speakers are deposited. As soon as the compatible speaker is selected, the physical deviations from the optimal reproduction are compensated and the sound experience is being even more optimised in this way.

To bring out the optimum of your Revox product, we recommend applying the following settings:

Push the button „Timer“ for two seconds and open the configuration menu of the M100 in so doing.

Within the configuration menu select the „Amplifier“ option in the left upper corner.

Select the presetting „Any/Unknown“ for all speakers that are not included in the list, in particular when using other speaker brands than Revox.

By means of the buttons Speaker +/- you can select your Revox speaker. Should the list not include your speaker from the current speaker range, please make sure that the latest firmware is installed on your M100.

In the next step you can make the adjustment to the placement of the speaker in the room. „No Adjustment“ indicates that the speaker stands in free space.

„Close to the wall“ optimises the playback of the woofer for a positioning within spitting distance to the wall.

For the positioning of the speakers in the corner of the room we recommend the setting „In the Corners“.
